

Game Lead Finder

Automated M&A Intelligence for Mobile Games

CrazyLabs · Business Development · June 2026

265

active leads tracked

\$60K – \$150K/mo

What is this tool?

Purpose

Identify mobile games worth acquiring before competitors do — automatically.

Data source

Sensor Tower — top 10,000 games by downloads, Google Play + App Store, worldwide.

How it works

Every game is scored using a profit model, filtered by range, and sorted by signal strength.

Output

A live HTML dashboard: 4 tabs, sortable columns, notes, review tracking — rebuilt every run.

Two modes: Small targets \$60K–\$150K/mo · Standard M&A \$150K–\$2M/mo

How we estimate profit

Revenue Per Download (RPD) = $90\text{-day Revenue} \div 90\text{-day Downloads} \div 3$ = monthly estimate

RPD determines which model applies:

IAA Model

RPD < \$0.10

$\text{Downloads/mo} \times \$0.10 \times 50\%$

Pure ad-monetised games. Downloads drive revenue.

⚠ ~74% median error — always verify manually.

Blend Model

RPD ≥ \$0.10 & Rev ≤ \$1M/mo

$65\% \times \text{Revenue} + 35\% \times \text{IAA estimate}$

Hybrid games with both ads and in-app purchases.
~33% median error — reasonable for screening.

IAP High

Revenue > \$1M/mo

$42\% \times \text{Revenue}$

Strong IAP titles. Revenue is the dominant signal.
~30% median error — most reliable model.

How we validated the model

30

anchor games

2025

full-year data

3

model types tested

42%

IAP margin (calibrated)

Sample anchor games (known 2025 monthly profit vs. model prediction):

Game	Model type	Actual profit	Predicted	Error
Zombie Waves	IAP High	\$500K	\$1,213K	+143%
SuitU	IAP High	\$820K	\$559K	-32%
Lamar – Idle Vlogger	IAA	\$400K	\$210K	-47%
Coffee Mania	Blend	\$270K	\$247K	-8% ✓
Heroes vs Hordes	Blend	\$150K	\$179K	+19% ✓

Full calibration: 2 missing games (Dazzly, Royal Escape) — not in 2025 Sensor Tower export

Who we filter out — and why

Hardcoded list (80+ publishers)

Major publishers we'd never acquire

EA, Supercell, King, Tencent,

Zynga, Kabam, Playtika...

Manually curated.

Updated as needed.

Auto-exclude rule

Any publisher appearing

8+ times in the filtered

dataset is excluded.

Catches established studios

not on the hardcoded list.

Calibration anchors (30 games)

Known benchmark games

used to validate our model.

Excluded from output so

they never appear as 'new'

acquisition targets.

Result: output contains only independent, acquirable studios in the relevant profit range.

Growing · Stable · Declining · Returning

 Growing	 Stable	 Declining	 Returning
> +10% revenue trend Games gaining momentum — highest priority for outreach.  May already exist in Salesforce. Cross-check before contacting.	-10% to +10% revenue trend Consistent performers. Verified NOT in Salesforce — cleanest leads list.  Safe to act on immediately.	< -10% revenue trend Revenue falling. Could be a motivated seller — or a trap. Verify before pursuing.  May already exist in Salesforce. Cross-check before contacting.	Cross-platform or prior-run signal Games found on both Google Play AND App Store, or reappeared from a prior run. Strongest signal: performing across platforms.

Execute & Upload

EXECUTE

Sensor Tower API — in progress

One-click full refresh

- Connect to Sensor Tower API directly
- Pull latest 90-day data automatically
- Re-run analysis and rebuild dashboard
- No CSV exports, no manual steps
- Schedule: runs every 1st of the month

UPLOAD

Live today via local server

Manual CSV upload

- Upload one or multiple CSV files
- Drag & drop or file picker
- Supports Google Play + App Store together
- Cross-platform dedup runs automatically
- Dashboard reloads when complete

Turning leads into a deal workflow

Today

- Stable tab = verified not in Salesforce
- Growing / Declining / Returning may overlap with existing CRM records
- Manual cross-check required before outreach

Coming soon

Real-time dedup

Every game checked against Salesforce on each run — no duplicates ever

Deal stage overlay

See 'In Outreach', 'Meeting Booked', 'Pass' next to each game in the dashboard

Coming soon (continued)

Auto-push leads

New games pushed to Salesforce as Opportunities with pre-filled fields

Smart routing

Games > \$100K auto-assigned to senior managers; geography-based routing

Details that matter

Two profit ranges

Small targets: \$60K–\$150K/mo | Standard M&A: \$150K–\$2M/mo
Same model, different filter. Run separately as needed.

Cross-platform signal

Games in the Returning tab were found on BOTH Google Play (worldwide) AND App Store (US).
Strongest possible signal — they perform across ecosystems.

IAA flag

All IAA-model games are marked with  in the dashboard.
Median error ~74% — always verify before presenting to management.

Added date is preserved

Every game remembers when it first appeared in the output.
Re-running the pipeline never resets historical dates.

Model accuracy is honest

IAA ~74% error | Blend ~33% | IAP High ~30%
This is a screening tool, not a valuation model. It surfaces candidates.

Notes & review tracking

Checkboxes and notes per game are saved in the browser (localStorage).
Summary card shows % reviewed and how many games have notes.

What we built

A fully automated, calibrated, and presentation-ready acquisition pipeline.

- ✓ Profit model calibrated against 30 real games with 2025 actuals
- ✓ 80+ publisher exclusions + auto-exclusion rule
- ✓ 4-tab dashboard: Growing / Stable / Declining / Returning
- ✓ Cross-platform dedup: Google Play + App Store in one output
- ✓ Date tracking, notes, review progress — all persisted
- ✓ Upload button live today · Execute + Salesforce coming next
